

Evolution of transport

Transportation evolves and still holds the blue print of what it use to be

A trip that use to be near impossible is now possible in a single day

(latitude 39°44'41.64" North, longitude 104°57'52.20" West.)

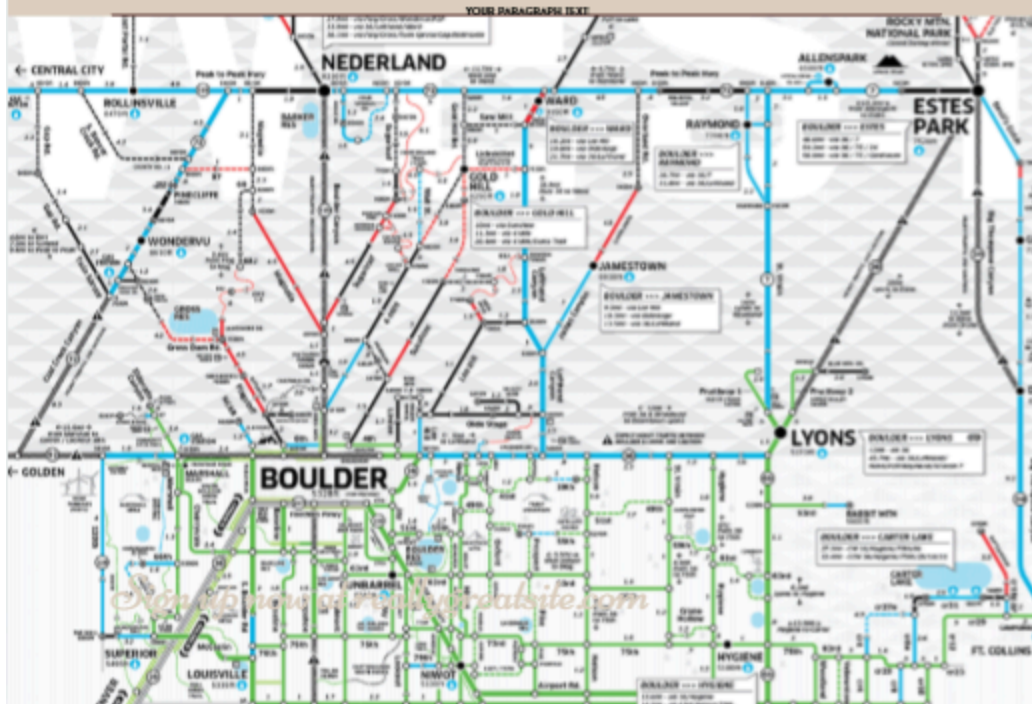

These two maps illustrate the same state around two hundred years apart. Many of the historical trails have transformed from old horse trails into interstate highways using the same bits of land. The day-long trip it used to be to get from Denver to Boulder has transformed into a 45 minute drive between the two. Using the same path on the same land highlights how this is truly one world we live in.

Today you can get around in so many different ways. One highlighted in this map is the capability of a bicycle to get oneself around the boulder area. Having access to paths that allow someone to bike from Denver to Estes park in a single day highlights the transportation evolution that has taken place in the world.
